Topic-Transfer of Training or Learning

The word transfer is used to describe the effects of past learning upon present acquisition. In the laboratory and in the outside world, how well and how rapidly we learn anything depends to a large extent upon the kinds and amount of things we have learned previously.

In simple way transfer may be defined as "the partial or total application or carryover of knowledge, skills, habits, attitudes from one situation to another situation."

Hence, carryover of skills of

one learning to other learning is transfer of training or learning. Such transfer occurs when learning of one set of material influences the learning of material later. For example, a person who knows to drive a motor car can easily learn to drive a scooter.
